

UI/UX Design Brief

ApplyWizz Workday Dry-Run Automation Engine V1

1. File Name

ui ux

2. Product Name

ApplyWizz Workday Dry-Run Automation Engine

3. Purpose of This Document

This document defines the visual and interaction design direction for the ApplyWizz Workday Dry-Run Automation Engine.

The goal is to make the product:

- simple for non-technical operators
- professional for internal company use
- clean and modern
- easy to understand
- safe for high-risk actions
- ready for web now and mobile later

The app should not look like a basic admin panel. It should feel like a serious internal operations product.

4. Overall Design Direction

The design should be:

Minimal
Professional
Modern
Dark-mode first
Operator-focused
Calm

Clear
Fast to scan

The app should feel similar to:

- Linear
- Vercel Dashboard
- Supabase Dashboard
- Raycast
- Stripe Dashboard

The design should avoid:

- too many colors
- childish illustrations
- cluttered layouts
- heavy shadows
- confusing menus
- flashy animations
- large empty screens without guidance

5. Design Personality

The UI should feel like:

A mission-control dashboard for Workday automation.

It should give the operator confidence that:

- the system is controlled
- every automation step is visible
- risky answers are not guessed
- human review is respected
- final submission is protected

The UI should communicate safety and control.

6. Primary UI Principle

The main design principle is:

Show status clearly. Show risk clearly. Make the next action obvious.

Every screen should answer:

1. What is happening?
2. What needs my attention?
3. What can I safely do next?
4. Is this job ready, blocked, failed, or waiting for review?

7. Theme Preference

Use **dark mode first**.

Light mode can be added later, but V1 should prioritize dark mode.

Reason:

- better for operations dashboards
- easier for long working hours
- modern SaaS look
- easier to highlight status and risk

8. Color Palette

8.1 Background Colors

Use a dark neutral base.

Main background: #09090B
Surface background: #111113
Card background: #18181B
Elevated surface: #1F1F23
Border color: #2A2A2E

8.2 Text Colors

Primary text: #F4F4F5
Secondary text: #A1A1AA

Muted text: #71717A
Disabled text: #52525B

8.3 Primary Brand Color

Use a modern blue or violet.

Recommended primary:

Primary: #6366F1
Primary hover: #4F46E5
Primary soft background: #312E81

This gives a professional AI/SaaS feel.

8.4 Accent Colors

Use accent colors only for status and risk.

Success: #22C55E
Warning: #F59E0B
Danger: #EF4444
Info: #38BDF8
Review: #A855F7
Neutral: #71717A

9. Status Color Rules

Status colors must be consistent across the app.

Queued: Neutral gray
Running: Info blue
Waiting for OTP: Warning amber
Manual Review: Purple
Dry Run Complete: Success green
Ready: Success green
Needs Review: Warning amber
Blocked: Danger red
Failed: Danger red

Submitted: Success green
Duplicate: Neutral gray
Skipped: Neutral gray

Never use random colors for statuses.

10. Risk Color Rules

Risk must be visually clear.

Low Risk: Green
Medium Risk: Amber
High Risk: Red
Unknown Risk: Purple or Gray

High-risk questions should always stand out clearly.

11. Typography

11.1 Font Direction

Use a clean modern sans-serif.

Recommended:

Inter

If Inter is unavailable, use:

System font / San Francisco / Roboto

11.2 Font Sizes

Use consistent hierarchy.

Page title: 28px / 32px
Section title: 20px / 28px
Card title: 16px / 24px

Body text: 14px / 22px
Small text: 12px / 18px
Table text: 13px / 20px
Button text: 14px / 20px

11.3 Font Weight

Page title: 700
Section title: 600
Card title: 600
Body text: 400
Muted text: 400
Button text: 600
Status badge: 600

Do not overuse bold text.

12. Layout System

12.1 Desktop Layout

Use a sidebar layout.

Left sidebar
+
Top header
+
Main content area

Desktop structure:

Sidebar width: 240px
Header height: 64px
Main content max width: flexible
Page padding: 24px
Card gap: 16px

12.2 Mobile Layout

Because the app is built with React Native / Expo, mobile should be considered from the start.

For mobile later:

```
Sidebar becomes drawer  
Tables become cards  
Manual review drawer becomes full-screen modal  
Actions move to bottom sticky buttons
```

V1 web dashboard should be desktop-first, but components should not block future mobile support.

13. Spacing

Use consistent spacing:

```
4px  
8px  
12px  
16px  
24px  
32px  
48px
```

Most components should use:

```
16px internal padding  
24px page padding  
16px gap between cards  
8px gap between small controls
```

14. Border Radius

Use modern rounded corners.

```
Small controls: 8px  
Cards: 12px
```

Modals: 16px
Badges: 999px pill style

Avoid sharp corners.

Avoid very large rounded corners that make the app feel playful.

15. Shadows and Borders

Use subtle borders more than heavy shadows.

Recommended:

Cards: 1px border using #2A2A2E
Modals: border + light shadow
Tables: border separators
Buttons: no heavy shadow

Dark mode should use borders for structure.

16. Component Style

16.1 Buttons

Use clear button hierarchy.

Primary button:

Filled primary color
White text
Rounded 8px
Medium height

Secondary button:

Dark surface
Border
Primary or white text

Danger button:

Red background or red border
Used only for destructive actions

Ghost button:

Transparent
Muted text
Used for small actions

16.2 Button Labels

Use action-focused labels.

Good examples:

Start Dry Run
Upload Resume
Connect Zoho
Review Questions
Continue Run
Approve Final Submit
Retry Run
View Error

Avoid vague labels like:

Submit
OK
Proceed
Click Here

17. Cards

Use cards for:

- dashboard metrics
- candidate summary
- run summary
- status panels

- readiness score
- manual review items

Card style:

Dark surface
1px border
12px radius
16px or 20px padding
Clear title
Small supporting text
Action button if needed

18. Tables

Use tables for:

- candidates
- job links
- runs
- answer bank

Table style:

Dark background
Subtle row separators
Sticky header if table is long
Status badges
Action menu on right
Search and filters on top

Rows should be clickable when they lead to detail pages.

Hover state:

Slightly lighter background

19. Status Badges

Status badges should be small pill components.

Badge style:

Rounded pill
Small text
Icon optional
Soft background color
Clear status text

Examples:

Running
Needs Review
Dry Run Complete
Failed
Submitted
Blocked

20. Forms

Forms should be simple and not overwhelming.

Use grouped sections.

Example candidate form sections:

Basic Information
Contact Details
Career Details
Work Authorization
Links

Input style:

Dark background
1px border
Clear label
Placeholder text
Error text below input

Required fields should be marked clearly.

Do not hide important fields behind too many steps unless needed.

21. Modals

Use modals for focused actions:

- upload resume
- add job link
- bulk add links
- replace resume confirmation
- final submit confirmation
- retry confirmation

Modal style:

Centered
Dark elevated surface
16px radius
Clear title
Short explanation
Primary and secondary buttons

Dangerous actions must include confirmation copy.

22. Drawers

Use right-side drawers for details that support the current page.

Good drawer use cases:

- manual review detail
- run step detail
- candidate quick edit
- screenshot metadata

Drawer style:

Slides from right
Width around 420px to 560px on desktop
Full screen on mobile

23. Manual Review UI

Manual review is one of the most important screens.

It must be extremely clear.

Each review item should show:

- Question
- Candidate
- Company
- Suggested answer
- Confidence score
- Risk level
- Reason for review
- Screenshot preview

Actions:

- Approve Suggested Answer
- Edit Answer
- Mark Unsafe
- Save to Answer Bank
- Continue Run

High-risk items should use red warning styling.

The UI should never make risky questions look normal.

24. Dry-Run Summary UI

The dry-run summary page should feel like a final checklist.

It should show:

- Candidate
- Company
- Job title
- Resume uploaded
- Account used
- Questions found
- Answers filled

Manual review count
High-risk warnings
Screenshots
Readiness score

Readiness score should be very prominent.

Use three states:

Ready
Needs Review
Blocked

The final submit button should only appear when status is Ready.

25. Final Submit Interaction

The final submit action must feel serious.

Before final submission:

- show confirmation modal
- explain that submission cannot be undone
- show candidate and job name
- show warning if there were manual overrides

Confirmation text:

Are you sure you want to submit this Workday application?
This action cannot be undone.

Buttons:

Cancel
Submit Application

The submit button should use a serious primary style, not a casual style.

26. Icons

Use simple line icons.

Recommended icon library:

Lucide React Native

Use icons for:

- candidates
- jobs
- runs
- review
- settings
- warning
- success
- failure
- upload
- link
- mail
- browser
- database

Icons should support clarity, not decoration.

27. Animation

Use minimal animation.

Allowed:

- button loading spinner
- drawer slide
- modal fade
- table row hover
- progress step update

Avoid:

- bouncing effects
- playful animation
- distracting transitions
- slow page transitions

The app should feel fast and serious.

28. Loading States

Every async action must show a loading state.

Examples:

```
Saving candidate...
Uploading resume...
Connecting Zoho...
Starting dry-run...
Waiting for worker...
Reading OTP...
Extracting questions...
Mapping answers...
Loading screenshots...
Submitting application...
```

Buttons should be disabled while the action is running.

29. Empty States

Empty states should tell the user what to do next.

Examples:

```
No candidates yet.
Create your first candidate to start a Workday dry-run.
```

```
No manual review items.
Everything is clear for now.
```

```
No job links added.
Paste a Workday link to begin.
```

Each empty state should include one primary action button.

30. Error States

Errors should be clear and useful.

Bad:

Something went wrong.

Good:

OTP was not found within the allowed time.
You can retry OTP reading or check the candidate mailbox.

Every error should include:

- what failed
 - possible reason
 - next action
-

31. Accessibility Requirements

The app should be accessible enough for daily internal use.

Requirements:

- strong color contrast
 - minimum body text size 14px
 - clear focus states
 - keyboard navigation for web
 - button labels must be descriptive
 - status should not rely only on color
 - error messages should be readable
 - form fields should have visible labels
 - modals should be dismissible
 - dangerous actions should require confirmation
-

32. Responsive Requirements

Desktop

Primary target for V1.

Must support:

1366px width
1440px width
1920px width

Tablet

Should be usable.

Tables may become horizontally scrollable or card-based.

Mobile

Future support.

React Native components should be designed so they can later become:

mobile cards
bottom actions
full-screen review pages
drawer navigation

Do not build desktop-only components that are impossible to adapt.

33. Page-Specific Design Direction

33.1 Dashboard

Should feel like an operations command center.

Use:

- metric cards
 - activity feed
 - jobs needing attention
 - worker health
 - recent failures
-

33.2 Candidates

Should be fast to search and manage.

Use:

- table view on desktop
 - candidate cards on mobile later
 - resume and Zoho status badges
-

33.3 Candidate Detail

Should be the main workspace.

Use sections:

Profile
Resume
Zoho
Answer Bank
Job Links
Runs
Manual Review

Each section should be a card.

33.4 Job Links

Should focus on queue status.

Use:

- filters
 - bulk actions
 - status badges
 - retry actions
-

33.5 Runs

Should show automation progress clearly.

Use:

- timeline
- live status
- screenshots

- logs
 - extracted questions
 - mapped answers
-

33.6 Manual Review

Should be the most careful screen.

Use:

- risk badges
 - confidence score
 - screenshot preview
 - approve/edit actions
 - strong warning states
-

33.7 Answer Bank

Should feel like a knowledge base.

Use:

- tabs
 - searchable table
 - risk filters
 - usage count
 - last used date
-

33.8 Settings

Should be simple and technical but readable.

Use:

- API status cards
 - worker status
 - dry-run rules
 - submit settings
 - environment info
-

34. Preferred UI Layout Example

Main logged-in layout:

Sidebar	Header: Page Title / Worker Status / User
Dashboard	Main Content Cards / Tables / Timeline / Review Panels
Candidates	
Job Links	
Runs	
Manual Review	
Answer Bank	
Settings	

35. Design Do's

Do:

- use dark mode
- use clean spacing
- use consistent badges
- show clear status
- show clear risk
- make primary action obvious
- use screenshots for trust
- use timelines for automation runs
- use confirmation before submit
- use helpful empty states
- design for desktop first, mobile later

36. Design Don'ts

Do not:

- use bright random colors
- make the app look playful
- hide high-risk questions
- make submit too easy
- use unclear button labels
- build huge unorganized forms

- use heavy shadows everywhere
 - show too many actions at once
 - rely only on color for status
 - expose technical logs to operators by default
-

37. Final UI/UX Direction

The ApplyWizz Workday Dry-Run Automation Engine should feel like:

A clean, dark, modern operations dashboard for safe automation.

The best design reference is:

Linear + Vercel + Supabase dashboard style

The most important UI rule is:

Make automation visible.
Make risk obvious.
Make human approval clear.

The product should help operators confidently manage Workday automation without needing technical knowledge.
